This is a super simple app that basically educates the user about zodiac signs. It will consist informations like Traits, Strengths, Weakness, Ruler etc.

I am going to be using a JSON file that I have already found to grab the information about different zodiac signs. The logic for this app will be very simple, its a multiple screen display that has information! A Lot of the information will be static. The horoscope will be the only information that will change everyday. I have the icons I need for this app and I will probably make some more. I have an idea of adding people in the app, so they can be displayed in the compatibility chart, so I am planning on storing them as a key value pair, which will be simple. I might use the Aries logo as my app icon because I am an Aries and I love the sign!
